ADUG Meeting February 2020, Bernhard Nobis

This was the first meeting of the new interest group. Bernhard presented and explained physical features of smartphones which also can be used as criteria for the purchase of a phone. Apart from familiarisation it served to identify features as topics for future meetings. Features identified were cameras, storage, audio and syncing.

We then looked at the basics of a smartphone, the home screen(s) and the apps drawer, including how to create folders and add a web page to the home screen. We then looked shortly at a widget. It is a function of Google Drive enabling to scan a page of a book or a document and to create this as a pdf file in a chosen folder of Google Drive.

It was decided to continue with more home screen options during the next meeting, e.g. widgets, themes, wall paper. Other topics for further meetings were identified, namely a comprehensive look at phone options, at phone security and printing any document using WiFi. However the major emphasis of all following meetings is to be an individual apps.

Experienced members of the group helped to assist with some individual issues.
